DETAILED ACTION

Reason For Allowance

1. Claims 1-16 are allowed.
2. Following is an examiner's statement of reasons for allowance:

The prior art taken either singularly or in combination fails to anticipate or fairly suggest the limitations of the independent claim(s), in such a manner that a rejection under 35 U.S.C. 102 or 103 would be proper. The prior art fails to teach a combination of all the claimed features as presented in independent claims 1 and 11, which include (claim 1) a stage formed on a substrate, with the stage being rotatable about an axis which is substantially perpendicular to a major surface of the substrate, a mirror formed on the stage at an initial position which substantially parallel to the major surface of the substrate and, with the mirror being subsequently movable to an erected position which is oriented substantially perpendicular to the major surface of the substrate; (claim 11)

a stage formed on a substrate, with the stage being rotatable about an axis which is substantially perpendicular to a major surface of the substrate, a mirror formed on the stage at an initial position which substantially parallel to the major surface of the substrate and, with the mirror being subsequently erectable to an erected position with a light-reflecting surface of the mirror being oriented at an angle to the major surface of the substrate, an electrically-severable fuze attaching one end of the mirror to the substrate during fabrication thereof, with the mirror being releasable for movement after the fuze is electrically severed by an electrical current.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue

fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Hagelin et al. (US 6,386,716 B2) discloses an optical mirror system with multi-axis rotational control in figure 1 comprising of a stage (101) formed on substrate, an actuators 105; however, Hageling et al. fail to teach or suggest wherein the stage being rotatable about an axis which is substantially perpendicular to a major surface of the substrate, a mirror formed on the stage at an initial position which substantially parallel to the major surface of the substrate and, with the mirror being subsequently movable to an erected position which is oriented substantially perpendicular to the major surface of the substrate.
